

Build Steps

Part 1 of 5 — Set up the agent, orchestration, and knowledge

1 Create Your Copilot Studio Agent

Open Copilot Studio (copilotstudio.microsoft.com), select Create → New agent, then configure:

Agent Name	Customer Service Insights Copilot
Description	Agents triage cases and escalate intelligently; managers monitor SLA, CSAT, and escalation patterns in real time.
Solution / Environment	Customer Service Solution · Default environment
Icon	Use a recognisable colour and emoji or upload a brand icon

2 Choose Orchestration Mode

Under Settings → Generative AI, choose how the agent decides what to do:

Generative Orchestration

Recommended — AI-led

- Agent reasons over user input and picks the right topic, tool, or knowledge
- Handles paraphrases, multi-step asks, and follow-ups naturally
- Best for varied user intent and exploratory questions
- Requires clear instructions, tool descriptions, and good knowledge

Classic Orchestration

Deterministic — trigger-led

- Topics fire on explicit trigger phrases you author
- Predictable flows, easier to audit step-by-step
- Best for tightly-scoped, regulated, or compliance-critical journeys
- Less forgiving of phrasing the author didn't anticipate

For this build we use Generative Orchestration so the agent can blend knowledge lookups with tool calls for customer service operations.

3 Add Knowledge

Go to the Knowledge tab → Add knowledge → File, then upload `Customer_Service_Cases_Data.xlsx`. This file contains:

- Case details (case ID, customer, region, product, issue type, channel)
- Operational data (priority, status, assigned agent, escalation flag)
- Time data (opened, resolved, first response, resolution time)
- Outcome data (SLA Met, CSAT score 1-5)

You can layer additional sources later — SharePoint sites, Dataverse, public web, or Graph connectors.

Build Steps

Part 2 of 5 — Add instructions and a custom topic

4 Add Agent Instructions

Open Overview → Instructions and paste the following (these guide the model regardless of orchestration mode):

You are the Customer Service Insights Copilot. You help two audiences:

- 1) Customer service agents working their queue.
- 2) Service managers monitoring SLA, CSAT, and escalations.

Rules:

- Use the uploaded case data as your single source of truth.
- For analytical questions, calculate from rows and show your working.
- For escalations, call the 'Escalate Case' tool – never just say 'escalated'.
- Always show case ID, customer, priority, and SLA status in answers.
- Treat customer data with care: never expose another customer's data.

5 Add a Custom Topic

Go to Topics → Add a topic → Create from description. Topics are reusable conversation flows the agent can call when intent matches.

Topic name: Escalate Case

Description: Lets an agent escalate a case to a manager with a structured reason, updating Dynamics 365 and notifying the on-call manager.

Trigger phrases (Generative Orchestration uses these as intent hints, Classic mode uses them as exact triggers):

- Escalate case CS4007
- I need to escalate this
- Send this to a manager
- This case is urgent

Conversation steps:

- Identify the case ID (confirm if ambiguous)
- Show the current priority, status, and SLA status from knowledge
- Ask for an escalation reason (Customer impact / Tech blocker / Other)
- Call the 'Escalate Case' tool to update D365 and notify the manager
- Confirm the new owner and expected response window

Build Steps

Part 3 of 5 — Add a tool and configure settings

6 Add a Tool

Tools let the agent take an action, not just answer. Go to Tools → Add a tool, and choose one of:

- Prebuilt connector (Outlook, Teams, SharePoint, Dataverse, ServiceNow, etc.)
- Power Automate cloud flow (custom logic you author or already own)
- Custom HTTP request (any REST API your agent can reach)
- Model Context Protocol (MCP) server — for richer tool ecosystems

Tool name: Escalate Case

Type: Dynamics 365 connector (Update record on 'incident' + Teams adaptive card)

Description: Sets escalation flag, raises priority if needed, notifies the on-call manager.

Inputs the agent will collect or infer:

- Case ID (string)
- Escalation reason (Customer impact / Tech blocker / Other)
- Free-text context (string)
- Suggested new priority (P1 / P2)

Outcome: Returns the updated case owner and posts an adaptive card to the team channel.

7 Configure Settings

Open the Settings cog (top right). Configure these four areas before you let real users near the agent:

- General — confirm name, description, and primary language
- Generative AI — orchestration mode and content moderation level (start at Medium)
- Authentication — use 'Authenticate with Microsoft' so the agent runs as the signed-in user
- Security — review DLP policy, enabled channels, and end-user authentication

Build Steps

Part 4 of 5 — Evaluate, test, and publish to a channel

8 Evaluate Your Agent

Go to Analytics → Evaluations → New evaluation. Build a test set so you can measure quality before and after every change.

Test set name: Customer Service Copilot – Baseline v1
Approach: Pair each input prompt with an expected outcome.
Run the evaluation and review three scores per response:

- Groundedness – did the answer stay inside the knowledge?
- Relevance – did it actually address the question?
- Accuracy – did it match the expected outcome?

Sample evaluation items:

Input: Show me all escalated cases with customer and agent

Expect: Returns rows where Escalated = Yes, including required columns.

Input: What's the SLA Met rate by priority?

Expect: Calculates percentage of SLA Met = Yes per priority and ranks them.

Input: Escalate CS4007 – customer impact is high

Expect: Triggers the Escalate Case topic end-to-end and updates D365.

9 Test in the Test Pane

Use the Test pane (right side of the canvas) while you build. For each query, click Activity map to inspect what the agent did:

- Which topic, tool, or knowledge source fired (and in what order)
- Inputs the agent collected and outputs the tool returned
- Citations linking each answer back to a row of your knowledge file
- Latency per step — useful when tuning multi-tool flows

10 Publish to a Channel

When you're happy, click Publish (top right). Then open Channels and enable the surfaces your users live in:

- Microsoft Teams — submit for admin approval, then pin to a team or chat
- Microsoft 365 Copilot — surface the agent inside Copilot Chat for licensed users
- Custom website — copy the embed snippet for an intranet page
- Other channels — Slack, Facebook, Telephony (Azure Communication Services)

Teams and M365 Copilot channels require tenant admin approval before users see the agent — plan for that lead time.

Try These Live

Part 5 of 5 — Sample queries to test your agent during the build-along.

Queue & Triage

Show me all cases currently Escalated.
Which agent has the most open cases by priority mix?

Experience & SLA

What is the average first response time by priority?
Which customers have given a CSAT score below 3 – and why?

Governed Action

Escalate CS4012 with reason 'Customer impact – major outage'.
List cases I escalated this week to verify the audit trail.

How to Think About This Agent

This agent replaces:

- Manual queue triage in case management
- Side-conversations to chase escalation app
- Weekly QBR data pulls and copy-paste dec

With:

- ✓ Triage and escalation in a single conversational flow
- ✓ Structured escalation reasons feeding QBR data
- ✓ Real-time visibility into SLA and CSAT signals

Trusted, governed, enterprise AI — built once, used everywhere.

Tip for real-world use

Use Dynamics 365 business unit security on the agent so each region sees only its own cases. Add an Evaluation set that mimics your top 20 most-common customer questions so quality stays measurable as you iterate.

You've built a Copilot Studio agent ✓

You now have an AI agent that can:

- Triage cases in conversation
- Escalate with full audit trail
- Surface SLA and CSAT risk
- Lift agent productivity and CX
